Iowa leads 16 states to end the truck parking search

Request: $6M Federal (71% share) · $2.4M non-Federal committed (29% — exceeding the 20% required, led by private-partner contributions). Iowa DOT, lead applicant — supporting the CCAI year-one work plan, I-35 Anchor State activities, and the I-80 Corridor Coalition. Right-sized to the program: $120M across ~20 expected awards.

60 → 30 min
END-OF-SHIFT PARKING SEARCH

~56 min/day
national average a trucker spends hunting for parking (ATRI driver diaries) — ≈$5,000/yr in lost wages

16 states, 2 corridors
— I-35 border to border, I-80 coast to coast, meeting at the Iowa crossroads

Live instruments today
— predictions calibrated against Iowa's own rest-area camera counts

What Iowa is proposing

A multi-state project on the I-35 and I-80 corridors that brings **public and private data together** for the two problems drivers feel most: work zones that appear without warning, and nowhere to park at the end of a shift. States keep publishing exactly what they publish today — no new systems, no new staff. The project layers independent evidence on top, verifies every work zone, predicts parking availability at every facility hourly, and delivers one trusted feed to the places drivers already look.

How it works

Public data
511/TMC work zone reports · parking sensors, cameras & historical occupancy — states unchanged

→

+ Private data
vehicle probes · e-ticketing · connected devices · in-cab alert networks · fleet telematics & ELD · driver apps

→

Verify & predict
confidence score on every work zone · hourly parking prediction per facility

→

One exchange → drivers
navigation apps · in-cab systems · V2X/C-V2X · highway signs — validated data also returns to improve state feeds

Why Iowa leads credibly

- **The platform is operational today** — ingesting ~39 work zone feeds nationally, with parking predictions calibrated against Iowa's rest-area camera network.
- **Iowa is the geographic and institutional hub** — the two corridors physically meet here, and Iowa anchors the AASHTO-coordinated corridor initiative.
- **The coalition scales because the ask is small** — partner states join by letter of commitment; private providers are selected competitively after award.

What Iowans — and the nation — get

OUTCOME	WHY IT MATTERS
Parking search cut in half	Driver hours returned to the supply chain; freight moves on schedule
Fewer trucks on ramps & shoulders	A documented fatal-crash factor, reduced
Fewer hours-of-service violations	Drivers stop choosing between compliance and safety
Work zones visible in every nav app	Fewer rear-end crashes in queues; road workers safer
Public accountability	Monthly data quality report card per state, on a public dashboard

Accountability from day one

Performance is measured by instruments that already exist — parking prediction accuracy tracking and independent multi-source work zone verification — reported publicly, so FHWA and the Governor's Office can watch both corridors improve quarter by quarter.

Confidence score on every event · Hourly prediction per facility · Monthly state report cards · Public dashboard

Downstream, every day, corridor-wide

Supply-chain productivity ↑ · fuel burned searching ↓ · unsafe shoulder parking ↓ · hours-of-service violations ↓ — cutting the search in half pays out four ways, across the two corridors that carry the nation's freight.
